

Zenyatta

Phleum pratense

Key Features

- Long seed head
- Good standability
- Brown leaf resistant
- High tonnage
- Dark Green Color

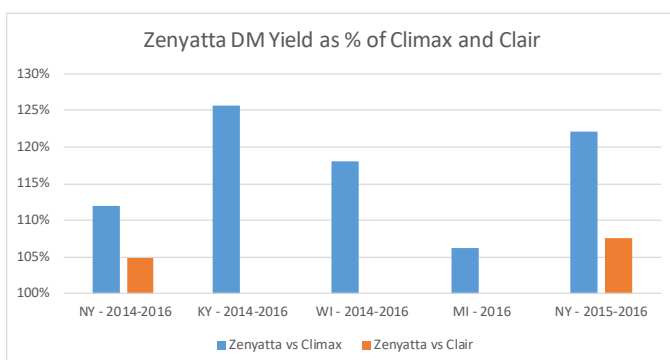

Zenyatta is very suitable for general pasture mixes and horse pasture mixes. It can be combined with alfalfa in three or two cut systems.

In the high value horse hay and the export timothy markets, Zenyatta outpaces the competition.

Zenyatta's consistent dark green color, minimal brown leaf problems, good standability and long seed head contributes to a high visual score. This along with high tonnage bring in top dollars for the hay producer and reseller. Excellent regrowth facilitates a profitable second cut.

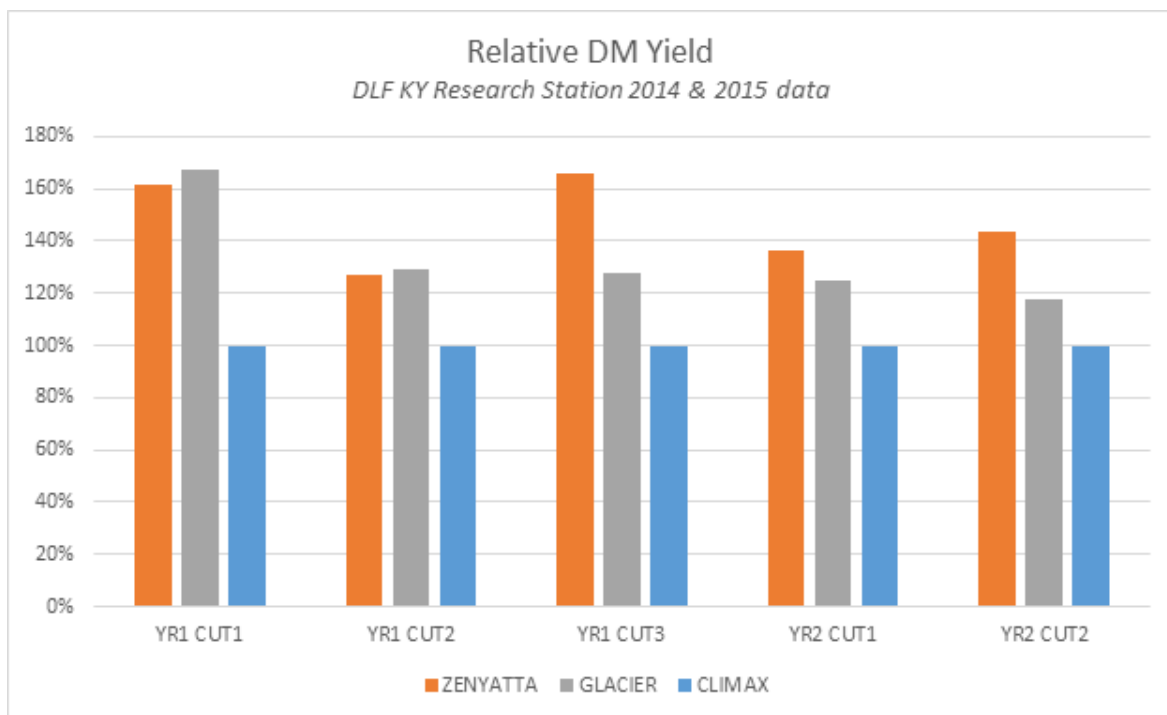

Zenyatta is a top yielding variety of timothy. Maturity is earlier than Climax and similar to Clair, yet DM yield is 10 – 25% higher in a broad range of University trials:

Zenyatta

Phleum pratense

The graph above shows Zenyatta and Glacier DM yield relative to Climax. Zenyatta proves its superior regrowth after cutting compared to both Climax and Glacier.
